

# Creation of a Data Bank of Farmland Rental Prices using FADN data

**Andrea Povellato**

with contribution from Barbara Bimbati, Oriana Gava and Giuliano Gabrieli

**CREA Centro di ricerca Politiche e Bioeconomia**

*28th PACIOLI-workshop*

Ptuj, Slovenia, 1st of October – 4th of October 2023

- Creating a **data base of rental prices** for multiple end users
  - Banca Dati dei Canoni di Affitto (**BDCA**)
  
- Expected end users:
  - **decision makers** (complementation of NUTS 2-level estimates, already available from Eurostat)
  - **farmers** with interest in renting in some agricultural land (in Italy 50% UAA is rented)
  - **consultants** and practitioners
  - **researchers**
  
- Source **Eurostat**
  - Statistics on agricultural land prices and rents. Handbook 2020 Edition
  
- **No** other information available in Italy

- Definition of the observation unit:
  - **Arable land** - land worked (ploughed or tilled) regularly (as defined for the latest Farm Structure Survey)
  - **Permanent grassland** - land used permanently (for five years or more) to grow herbaceous forage crops and that is not included in crop rotation
- Where the detailed prices for renting arable land or permanent grassland are available and appropriate data for separate weights exist, they shall be provided. They are otherwise non-mandatory
- Statistical data can be collected by means of / in combination of:
  - **Direct observation** of land prices and rents (through surveys like FADN)
  - Statistical data collection via a network of **experts**
  - Use of **administrative data** (used in Italy --> Eurostat)

## ➤ Includes

- the actual rent price agreed upon by the persons closing the transaction
- related levies/taxes
- payments in kind valuated at the current year price

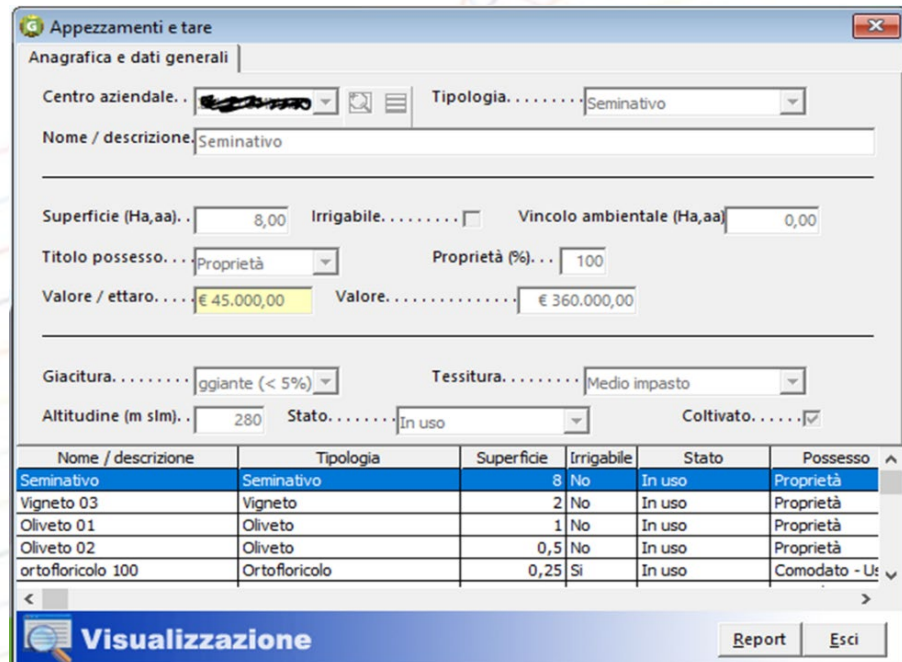

## ➤ Excludes

- entitlements related to the land
- deductible VAT
- rentals of buildings or dwellings situated on the land
- any other expenses related to other assets except the agricultural land (current maintenance expenditure on buildings, buildings insurance, depreciation of buildings, rents paid for the professional use of non-residential buildings etc.)

- Minimal request on FADN according to EU legislation:
  - **Rented UAA** (land not belonging to the holding for which a fixed rent is paid cash or in kind)
  - **Paid rent** for land
- There are some specific situations (not so important)
- The potential of RICA Italia, thanks to the particular data collection system
- General Accounting Bookkeeping through a specific software:  
**GAIA** (Gestione Aziendale delle Imprese Agricole)

The numbers of GAIA	FADN UE	FADN IT
Types of accounting records, divided into <b>80</b> types of accounting transactions	< 20	30
Accounts managed directly by user	0	280
Types of agricultural machinery and equipment ( <i>farm tractor, farm kit, tank car, etc.</i> )	0	300
Types of farm buildings ( <i>storehouse, stalls, greenhouse, dung-hill, silos, etc.</i> )	0	70
Types of soil ( <i>physical characteristics and fertility</i> )	0	20
Crop species ( <i>arable land and arboreal</i> ) and <b>6800</b> cultivars	< 100	380
Animal species and categories	< 30	100
Breeds ( <i>attitude: beef, milk, mixed, eggs, etc.</i> )	10	290
Types of crop products ( <i>primary and processed – combinz crop-prod over 1.055 case</i> )	< 50	54
Types of livestock products ( <i>primary and processed</i> )	< 10	35
Categories of technical inputs ( <i>fertilizers, crop protection, feed, motor fuels, seeds, etc.</i> )	< 25	110
Types of public aid ( <i>investments subsidies and annual payments</i> )	< 300	500
Variables	1000	>2500

- The land "parcel":
  - **elementary territorial unit** within the farm
  - a share of agricultural land with **homogeneous** physical and productive characteristics and potential --> same type of crop / same tenure system / same pedological characteristics
  - may be made of **multiple parcels** with the same "land use" type
  
- This enables the creation of **crop categories** that we used to analyse and compare rental prices

The screenshot shows a software window titled "Appezamenti e tare" with a tab "Anagrafica e dati generali". The form contains the following fields and values:

- Centro aziendale: [redacted]
- Tipologia: Seminatorio
- Nome / descrizione: Seminatorio
- Superficie (Ha,aa): 8,00
- Irrigabile:
- Vincolo ambientale (Ha,aa): 0,00
- Titolo possesso: Proprietà
- Proprietà (%): 100
- Valore / ettaro: € 45.000,00
- Valore: € 360.000,00
- Giacitura: ggianta (< 5%)
- Tessitura: Medio impasto
- Altitudine (m slm): 280
- Stato: In uso
- Coltivato:

Below the form is a table with the following data:

Nome / descrizione	Tipologia	Superficie	Irrigabile	Stato	Possesso
Seminativo	Seminativo	8	No	In uso	Proprietà
Vigneto 03	Vigneto	2	No	In uso	Proprietà
Oliveto 01	Oliveto	1	No	In uso	Proprietà
Oliveto 02	Oliveto	0,5	No	In uso	Proprietà
ortofloricolo 100	Ortofloricolo	0,25	Si	In uso	Comodato - U

At the bottom of the window, there are buttons for "Visualizzazione", "Report", and "Esci".

- **Period:** 2010 - ongoing
- **Number of observations:** on average 5.500 farms with rented UAA per year out of 10.000 total farms per year
- **Geographic information**
  - regions (NUTS-2) - 20 classes
  - altitude + group of regions - 9 classes
- **Crop categories:**
  - specialisation (>66%) on arable crops
  - specialisation (>66%) on permanent grassland
  - specialisation (>66%) on vegetables and flower plants
  - specialisation (>66%) on permanent crops
  - mixed crops

- The Italian FADN survey is a sample survey that adopts a **stratified sampling plan**, which increases the **homogeneity** of the statistical units within the defined strata (more **efficient** estimates)
- Stratification variables - defined by region, type of farming and economic size - ensure good representativeness of the sample, controlling for the **three strategic variables**, Standard Output (SO), Utilised Agricultural Area (UAA) and economic size of farm
- **Post-stratification** of the Italian FADN sample consistent with the stratification of the BDCA:
  - Preliminary treatment for the identification of **potential anomalous data** carried out through a boxplot corrected for asymmetric distributions
  - Sample weights are **calibrated** on the total estimated rented UAA from the General Census of Agriculture

- Single **spreadsheet**
- Data are aggregated by NUTS 2 regions (**20 classes**) OR geographical area and altitude (**9 classes**) AND crop categories (**5 classes**)
- Cut-off: **>5** observations per class
- Yearly data :
  - number of observations
  - mean
  - median
  - 1st and 3rd quartiles
- The selected summary statistics enable the identification of a **range for rent prices** that includes a large share of observations

- There are many possible **determinants** for the rental price
- **1st Pillar payments**: information currently missing for rented UAA  
- to be added to the FADN survey? --> statistical burden
- **Other entitlements** (e.g., replanting rights), presence of agricultural **buildings**, presence of **irrigation** infrastructure, land **suitability**
- Use of **hedonic models**

➤ R

A wide-angle photograph of a lush green field filled with numerous small yellow wildflowers. In the background, there is a line of trees and a small grey building on the left. The sky is bright blue with scattered white clouds.

Thanks for the attention!
